***Abstract*—Blockchain, a system of connected blocks, originally used as a distributed, immutable, decentralized and peer to peer database but has advanced over the years and many use cases are now seen in the market. To put more simply, blockchain offers a peer-to-peer transactions kept out in open so that everyone can see each of the transactions. These transactions are secured by the cryptographic hashes which are unique for every block formed. Each transaction is timestamped and linked to the prior event, making it exceedingly resilient to malicious activities by making alter the extremely difficult but not impossible. In addition to financial services, blockchain has also developed many use cases in fields like voting, real estate, supply chain management and most essentially in healthcare.**

The current work compares two most common algorithms i.e. proof of work (PoW) and Proof of Stake for Infant Care Applications.

In addition to this the work also includes development of cryptocurrency with its applications and numerous functions. This work also highlights on how startups are benefited from this in terms of easy crowd funding and how this implementation will bring a boom in the Indian Startups.

Further this work also the concept of Initial Coin Offering to ERC-20 token standard contract using Solidity Programming Language.

***Index Terms*—blockchain, consensus algorithms, PoW, PoS, Smart Contracts, Initial Coin Offering, Cryptocurrency.**

I. INTRODUCTION

Cryptocurrency is one of the most trending word today in both academics as well as industry. Bitcoin, one of the most successful cryptocurrencies having a market value of 10 billion dollars in 2016 [1]. As blockchain can be identified asa distributed database, so its important use case in the field of healthcare was a database to store the medical records of the patients. One important use of using blockchain in the medicalservices industry is that it can change the interoperability of medical services information databases, giving expanded admittance to tolerant clinical records. Admittance to patients, clinical chronicles is fundamental and to accurately prescribe
